16. Base your answer to the following question on the information below and on your knowledge of chemistry.

Fruit growers in Florida protect oranges when the temperature is near freezing by spraying water on them. It is the freezing of the water that protects the oranges from frost damage. When H ${ }_{2} \mathrm{O}(\ell)$ at $0^{\circ} \mathrm{C}$ changes to $\mathrm{H}_{2} \mathrm{O}(\mathrm{s})$ at $0^{\circ} \mathrm{C}$, heat energy is released. This energy helps to prevent the temperature inside the orange from dropping below freezing, which could damage the fruit. After harvesting, oranges can be exposed to ethene gas, $\mathrm{C}_{2} \mathrm{H}_{4}$, to improve their color.
Determine the quantity of heat released when 2.00 grams of $\mathrm{H}_{2} \mathrm{O}(1)$ freezes at $0^{\circ} \mathrm{C}$.

Base your answers to questions 18 and 19 on the information below.

Heat is added to a 200.-gram sample of $\mathrm{H}_{2} \mathrm{O}(\mathrm{s})$ to melt the sample at $0^{\circ} \mathrm{C}$. Then the resulting $\mathrm{H}_{2} \mathrm{O}(\ell)$ is heated to a final temperature of $65^{\circ} \mathrm{C}$.
18. Compare the amount of heat required to vaporize a 200.-gram sample of $\mathrm{H}_{2} \mathrm{O}(\ell)$ at its boiling point to the amount of heat required to melt a 200.-gram sample of $\mathrm{H}_{2} \mathrm{O}(\mathrm{s})$ at its melting point.
19. In the space below, show a numerical setup for calculating the total amount of heat required to raise the temperature of the $\mathrm{H}_{2} \mathrm{O}(\ell)$ from $0^{\circ} \mathrm{C}$ to its final temperature.
20. Base your answer to the following question on the information below and you knowledge of chemistry.

A 100.-gram sample of liquid water is heated from $20.0^{\circ} \mathrm{C}$ to $50.0^{\circ} \mathrm{C}$. Enough $\mathrm{KClO}_{3}(\mathrm{~s})$ is dissolved in the sample of water at $50.0^{\circ} \mathrm{C}$ to form a saturated solution.
